[How customer reviews and ratings work](#)

[Sponsored](#)

Customers find this USB camera to be well-built and easy to install, working well with RaspberryPi and offering good value for the price. The camera performs well in various lighting conditions, with one customer noting its excellent 720p resolution for the price. While the functionality receives mixed reviews, with some reporting it stops working on its own, customers appreciate its compatibility and build quality.

Works great with my Raspberry Pi 3 using Motion Eye OS. The camera has been used for several months and the night vision works great for indoor use. The image is fantastic for the price! You would have no problem identifying an intruder from one of its output images. It was plug and play with the Motion Eye OS--100% compatible. I took a chance with this \$40 camera and it has been a great investment so far. The only difficulty, as other reviewers have mentioned, there is no instructions and the case is screwed on very tightly. A few gentle twists and the mounting bracket dislodged itself from the camera to allow for angle adjustments. It is very sturdy with a metal protective casing throughout.

Update: 11 months later and I am still very satisfied with this purchase. The camera works great and I have even bought extras for outdoor applications. All of the cameras are doing great!

OK so I decided to keep this camera after deciding to return it after having issues, This is because of an issue with the camera itself, you see if you at any time change the video source or switch USB ports the cameras exposure will be stuck on maximum for some reason, So all you'll see is a completely washed out super bright image making it impossible to see anything, The only fix for this is completely restarting the computer. This is a huge inconvenience. So when you use this thing just make sure to leave it plugged into one port and don't swap or change camera sources in your software or else you might end up with a washed out image like me. I am not sure if this is just an issue with my camera or not. I probably won't buy another one, But seeing how this is the only good wired night vision camera out there my other options are limited, this is the reason I decided to just keep it and deal with this issue.

Review: OK so the camera itself is actually very well built and can survive being in very heavy rain, The cord is plenty long enough to go through the window and inside to the PC. The sensor itself is pretty decent and supplies a fairly clear 720p image at 30 FPS. However the infrared LED's are not very good at all, The camera has a very narrow clear image at night, It seems that the infrared LED's don't disburse outwards enough to see everything within its field of view. Each evening I actually have to manually go into my camera software to raise the exposure and brightness in order to get a bright enough image to see anything otherwise it's really dark. I really would have liked for the manufacturer to add a wide angle lens attachment. I would gladly pay extra for it.

Pros:

- Very sturdy and well built
- Can survive heavy rain like a champ
- Decent sensor and framerate
- Easily mountable with only one screw
- Well insulated cable
- Wind won't move the position it's pointing at
- Affordable

Cons:

- Buggy
- Can sometime glitch out with flashes of light appearing on camera
- Infrared LED's are weak and can't see that far
- Slightly poor FOV

Recommended software: ManyCam, iSpy

Pictures: What you see is the same camera in the day time and what it looks like at night.

There isn't any printed documentation included with the camera. There's not even a link to it so that I can download it. On the elpcctv.com there isn't currently any download that I could find. It also doesn't come apart the way that the Amazon pictures show which are subtitled (Simply rotate to open the base for installation, nice and generous). I'll reach out to the manufacturer for information.

Downloaded and magnified the image - not much help.

Still nothing from the manufacturer. I carefully taped the larger part of the base, wrapped this in an automotive microfiber towel and put it in my shop vise. Still can't get it apart. Perhaps with a hammer but that's just wrong. After re-reviewing the pictures from others I know I'm doing it the correct way. If I don't hear from my tomorrow it's going to go back. I'll try one exchange before I give up which may be fruitless but I'm a really persistent techie.

Final thoughts: It worked reasonably well with one of my Raspberry Pi 3 B systems with MotioneyeOS installed. Gave up on getting completely tweaked to work with all the moving trees and vegetation since it became obvious that this was going to be returned. I had hoped to assemble a number of systems using this camera and Pi Zero W systems as a response to the one man crime wave that we had in our neighborhood. I'll have to find an equivalent product. YES - in the end I did a return to vendor.

For the price this is, its great. No other night vision camera comes close. Now for the negative, the frame rate is horrible. Even in daylight mode, its 4FPS. Its always a slideshow.
